New Electronic Compound Applicator

Computrol has received a patent for our new compound applicator for container closures that is capable of applying compound with no visible overlap.

Compound can be applied in one turn or two turns of lining, reducing the necessary chuck speed for satisfactory coverage and eliminating excess compound usage - resulting in lower operating costs for the compound lining machine.

The new applicator can be retrofitted to an existing liner (reciprocating or rotary) or supplied as part of a new liner.

The new applicator can be used with solvent-based or water-based compounds for can ends as well as plastisol for bottle caps.

This new design features improved lift control that provides reliability and repeatability from one applicator to another.

The controls for this applicator control the needle lift directly and can monitor changes in needle lift profile.

Testing has shown repeatability of ± 1.5 mg on 206 ends running at 250 ends per minute.

Contact Computrol about installing the new compound applicator on your lining machines!
